Studio Nirmiti

Master build prompt • 3D SEO website • visual admin editor • production QA

MASTER BUILD PROMPT

Designed to be pasted into Google Antigravity as the project s

PUBLIC SITE

46 core routes + dynamic content

ADMIN

Visual editor + CMS + SEO manager

USAGE

How to run this prompt

Use the prompt as a project constitution, not a one-shot visual request.

How to use

Create a new empty workspace in Antigravity. Attach the 60-page Studio Nirmiti blueprint PDF if the environment supports files, then paste the master prompt from this document. Tell the agent the blueprint is authoritative for routes, page structure and admin behavior.

Reference media

The client reference video has not been supplied in this conversation. When it is available, add it to the workspace and instruct Antigravity to use it only as visual interaction inspiration, not to copy branding or copyrighted assets.

Build style

Work in implementation phases. The agent must plan, build, run locally, test in the browser at multiple widths, fix issues, then proceed. Do not generate a static mockup only.

Important rule

Only the Home route gets a true hero section. Every inner route begins directly with contextual editorial content or a service/project intro block - no repeated full-screen hero banners.

Read this before writing code

ROLE

You are the lead product designer, senior frontend engineer, SEO engineer, CMS architect and QA owner for Studio Nirmiti.

CLIENT

Business: Studio Nirmiti. Contact: Kushal Kumar Pendekatla, 9573023509. Services include About Us, Architectural Designing, Interior Designing, Modular Kitchens, Furniture Selection, 3D Visualization, Walkthroughs, Project Supervision, Interiors, Exteriors, Execution Works and Space Planning. Project types: Residential, Commercial, Hospitality.

GOAL

Build a premium architecture/interiors website that feels spatial and 3D without becoming a neon/gaming site. It must generate leads, rank through clean SEO architecture and allow the owner to edit site content/layout safely from a visual admin dashboard without touching code.

NON-NEGOTIABLE

Real semantic HTML for searchable content; responsive; accessible; performance-aware; only Home has hero; all inner pages use editorial starts; admin visual editor controls content and safe layout variants; no invented awards, ratings, office addresses or project statistics.

STACK

Recommended implementation stack

Use latest stable versions and adapt only when required by the environment.

Framework

Use the latest stable Next.js App Router with TypeScript. Prefer server-rendered/static-rendered HTML for public content and metadata. Use the latest stable package versions available when building.

UI

Tailwind CSS or equivalent tokenized CSS system. Components must be reusable, accessible and driven by CMS data.

3D / motion

React Three Fiber / Three.js only where genuine spatial interaction helps; Framer Motion and/or GSAP for DOM motion. Lazy-load WebGL scenes and provide static fallbacks.

Backend / CMS

Recommended: Firebase Authentication + Firestore + Cloud Storage + App Hosting because Antigravity has first-party Firebase guidance. If the project environment has a better already-configured backend, preserve the same data model and security requirements.

Forms

Store enquiries securely; server-side validation and spam/rate protection. Never expose service credentials in browser code.

How Antigravity should work

1. Inspect first

Before changing files, inspect the workspace, dependencies and any provided reference media. Summarize what exists and what will be created.

2. Plan routes

Create a route/content matrix for all blueprint URLs. Do not omit routes because they are similar.

3. Build systems first

Create design tokens, global layout, navigation, footer, CMS data types, motion utilities and SEO helpers before copying page markup.

4. Verify each phase

Run lint/typecheck/tests/build and use browser testing after every major phase. Fix issues instead of hiding warnings.

5. Preserve SEO

Do not put essential copy only inside canvas. Keep headings and links in the DOM.

6. Report artifacts

After each phase, report files changed, routes working, tests run, known limitations and next phase.

Repository structure

App routes

app/(site)/... for public pages and dynamic projects/articles; app/admin/... for protected admin routes; api/server actions for authenticated mutations.

Components

components/layout, navigation, sections, 3d, motion, forms, projects, seo and admin. Avoid one huge component per page.

Content model

CMS content should map into typed section blocks. Public pages render sections from structured data, with robust defaults/fallbacks.

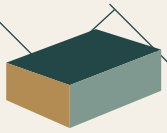

Lib

lib/cms, auth, seo, schema, analytics, validation, images and permissions.

Tests

unit tests for schemas/data transforms, component tests for core blocks, browser tests for navigation/forms/admin edit/publish.

Aesthetic 3D direction

Visual language

Warm architectural neutrals, deep green-charcoal, sage and restrained brass/gold accent. No neon gradients, sci-fi HUDs or oversized novelty typography.

Typography

Editorial sans-serif pairing, strong but not gigantic headings, comfortable body text, fluid sizes via clamp(), readable line lengths.

Surfaces

Rounded architectural cards, paper/material panels, line-drawing motifs, inset frames, soft realistic depth. Shadows are subtle and directional.

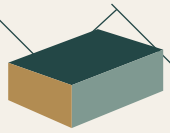

Grid

12-column desktop grid; content max width around 1200-1320px; generous white space; intentional asymmetry allowed.

Media

Project imagery is the main visual proof. 3D interface should frame the work, not compete with it.

3D interaction engine

Pointer

For cards/media frames, map pointer position to max 4-6 degree rotation and small translation. Return with spring. Never shift text enough to hurt reading.

Touch

On touch devices, use drag/orbit only inside explicit interactive regions. Vertical page scroll must remain natural. No hover-only information.

Scroll

Use one primary transition per section: reveal, depth-stack, mask or camera move. Avoid simultaneous motion overload.

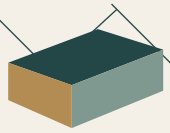

WebGL

Dynamically import; IntersectionObserver pause; DPR cap; low-complexity mobile version; static poster on unsupported/reduced-motion devices.

Reduced motion

Respect prefers-reduced-motion; remove parallax/camera drift and shorten transitions while preserving content and navigation.

Public routing & SEO rules

Routes

Implement every route in the blueprint exactly with lowercase hyphenated slugs. Add permanent redirects if a slug is later changed in admin.

Metadata

CMS-editable SEO title, description, canonical, OG/Twitter fields and indexable flag. Generate safe defaults from page data.

Structured data

Organization/LocalBusiness with verified details, WebSite on home, BreadcrumbList on inner pages, Service / CollectionPage / Article where appropriate.

Sitemap/robots

Generate XML sitemap for public indexable pages, projects and articles. Block /admin from crawling. Keep private APIs non-indexable.

Content rules

Each service page contains useful unique content. Do not mass-generate thin doorway pages. Page clusters must cross-link naturally.

Performance

Images responsive and optimized, explicit dimensions, below-fold lazy loading, fonts optimized, 3D deferred.

Public route contract

These are mandatory routes. Use the blueprint PDF for full section detail.

Core routes

/; /about; /contact; /projects; /services/architectural-design; /services/interior-design; /services/exterior-design; /services/execution-works; /services/space-planning; /services/modular-kitchens; /services/furniture-selection; /services/custom-furniture; /services/3d-visualization; /services/3d-walkthroughs; /services/project-supervision; /services/turnkey-interiors; /services/renovation-remodeling; /services/lighting-false-ceiling; /services/material-finishes; /services/wardrobes-storage; /projects/residential; /services/residential/apartment-interiors; /services/residential/villa-interiors; /services/residential/living-room-design; /services/residential/bedroom-design; /services/residential/dining-room-design; /services/residential/home-office-study; /services/residential/pooja-room-design; /projects/commercial; /services/commercial/office-interiors; /services/commercial/retail-showroom-interiors; /services/commercial/restaurant-cafe-interiors; /projects/hospitality; /services/hospitality/hotel-interiors; /services/hospitality/resort-interiors; /services/facade-design; /process; /why-studio-nirmiti; /faq; /insights; /insights/architecture; /insights/interiors; /insights/3d-visualization; /book-consultation; /privacy-policy; /terms

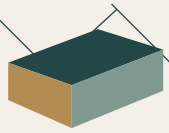

Dynamic extensions

Also support /projects/[slug] for case studies and /insights/[slug] for articles. These pages use CMS data, metadata, breadcrumbs, related content and project/article structured data where accurate.

Hero rule

Home / may use the only full hero. All other routes explicitly must not render the global Hero component.

Public content data model

Page

id, title, slug, route, status, seo, sections[], createdAt, updatedAt, publishedAt, revision.

Section block

id, type, order, enabled, variant, theme, spacing, heading, eyebrow, body, media, items, CTA, animationPreset, responsive overrides.

Service

title, slug, summary, body, category, relatedServices, relatedProjects, media, SEO.

Project

title, slug, projectType, serviceTags, location, scope, summary, challenge, approach, gallery, beforeAfter, video/walkthrough, SEO.

Article

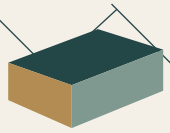

title, slug, category, excerpt, body blocks, cover, author if real, publishedAt, related pages, SEO.

Global

business info, phone, social URLs, navigation, footer, contact settings, theme tokens and default SEO.

SECURITY

Authentication, roles & rules

Authentication

Protect /admin. Use Firebase Auth or equivalent. No public sign-up for admin users. Owner account created intentionally.

Roles

owner: full access; admin: content/SEO/projects/leads; editor: content/media only. Only owner can manage users/critical settings.

Security rules

Public can read published content only. Authenticated authorized roles can write allowed collections. Validate data types and file uploads.

Storage

Validate MIME/type/size. Store alt text and metadata. Avoid public delete operations.

Secrets

All secret keys/server credentials in server environment. Never commit secrets.

Visual no-code page editor

Preview canvas

Admin editor shows the actual website page rendered with editing overlays. Clicking a section selects it without navigating away.

Section controls

Drag reorder, duplicate, hide/show, delete with confirmation, insert from section library and switch variants.

Inline content

Edit heading, eyebrow, body, buttons, list items and labels. Changes update preview immediately but remain draft until publish.

Layout controls

Allow controlled variants: full width, contained, split, media-left/right, 2/3/4 card grid, gallery styles, alignment, density and background token.

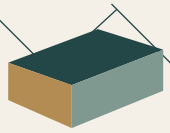

Responsive preview

Desktop/tablet/mobile buttons change editor canvas width. Store only meaningful responsive overrides.

Publish

Preview draft -> publish -> invalidate/revalidate route. Save version snapshot before publishing.

Media, projects, services & articles

Media library

Upload, browse, tag, replace, crop/focal point, alt text, dimensions, usage locations. Protect media in use from accidental deletion.

Project manager

CRUD project case studies, reorder gallery, select categories/tags, link related services and preview project route.

Service manager

Edit service content and media while preserving canonical route unless owner intentionally changes slug.

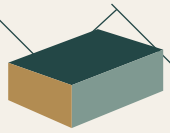

Article manager

Rich block editor for insights. Draft, schedule/publish if implemented, preview and related-page links.

Global blocks

Manage navigation, footer, social links, contact details and consultation CTA.

SEO manager requirements

Page SEO

SEO title character guidance, meta description preview, canonical, index toggle, social title/description/image.

Slug management

Changing slug requires warning + redirect creation. Prevent duplicate slugs.

Structured data preview

Show schema types generated for page, and validation warnings for missing verified fields.

Sitemap status

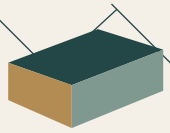

Display whether route is indexable/in sitemap and last publish time.

Internal-link suggestions

Suggest related service/project links based on tags, but owner chooses final links.

QUALITY

Responsive, accessibility & performance

Responsive

Test at 360, 390, 430, 768, 1024, 1280, 1440+ widths. No horizontal overflow. Content order remains logical.

Accessibility

Keyboard navigation, visible focus, semantic headings, labels/errors, alt text, contrast, reduced motion and no pointer-only controls.

Performance

Use server components where practical; code split 3D; avoid shipping admin code to public bundle; optimize media and fonts.

SEO rendering

Important page content should appear in initial/server-rendered HTML. Do not wait for client JS to inject primary service copy.

Error states

404, CMS unavailable fallback, image fallback, empty project states and form error/success states must be designed.

Phases 1-3

Build systems before 46 separate page implementations.

Phase 1 - Foundation

Initialize project, TypeScript, lint/format, styling tokens, global shell, fonts, responsive grid, route placeholders, auth/backend configuration. Verify production build.

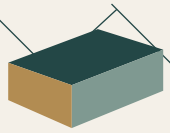

Phase 2 - CMS & types

Implement schemas/data types, Firestore/storage rules, typed data access, published/draft logic, global settings, seed content from blueprint. Add tests.

Phase 3 - Core UI

Build reusable section components, project cards, gallery, media frame, CTA, breadcrumbs, rich content and motion utilities. Build Home first as reference quality.

Phases 4-6

Phase 4 - Public routes

Implement all service/category/editorial/legal routes from blueprint using reusable blocks. Verify every URL, no inner-page hero, metadata and internal links.

Phase 5 - 3D experience

Add progressive 3D scenes only to selected sections/pages. Test low-power/mobile fallbacks and reduced motion.

Phase 6 - Admin

Implement login, dashboard, page editor, media, projects, services, insights, SEO manager, navigation, leads, users/roles, revisions and publish flow.

Phases 7-9

Phase 7 - SEO & schema

Sitemap, robots, canonical, redirects, structured data, social previews, content completeness and internal-link audit.

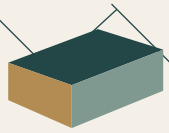

Phase 8 - QA

Run typecheck/lint/tests/build. Browser-test routes, forms, admin editor, save/publish, mobile menus, 3D input and accessibility.

Phase 9 - Deployment

Deploy production, verify environment variables/security rules/storage, smoke test live site and admin, then document handover.

Acceptance test checklist

Public routes

All blueprint URLs return 200, correct content, correct canonical/title, breadcrumbs on inner pages and no duplicate full-screen hero.

Admin

Owner can log in, edit any text/media, reorder/duplicate/hide sections, change safe layout variant, edit SEO, preview and publish.

Persistence

Refresh after publish reflects changes; draft not visible publicly; revisions recorded.

Forms

Consultation/contact submissions validate, store in leads inbox and show clear success/error state.

3D

Pointer/touch interactions work without trapping scroll; reduced-motion/static fallback works.

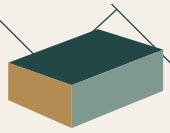

SEO

Sitemap/robots valid, schema has no critical errors, no accidental noindex, links crawlable.

Visual

No overlaps, blank sections, clipped text, off-screen controls or broken media at test widths.

Production and handover

Environment

Separate development/preview/production. Use environment variables for backend configuration.

Hosting

Prefer Firebase App Hosting or another SSR-capable platform compatible with chosen Next.js setup. Configure custom domain later when client provides DNS access.

Caching

Cache published content appropriately; invalidate/revalidate on publish.

Backups

Provide periodic/exportable backups of CMS data and media inventory or document recovery approach.

Monitoring

Capture frontend errors and form failures if monitoring service is configured; avoid unnecessary invasive tracking.

Handover

README with local setup, deploy process, admin guide, content model, roles and backup/restore notes.

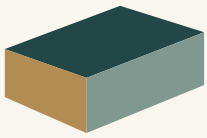

COPY / PASTE

MASTER PROMPT - PART 1

Paste these parts together as one master request, or send sequentially in the same Antigravity task.

MASTER PROMPT - PART 1

Build a production-ready website for Studio Nirmiti. Treat the attached 60-page blueprint as the authoritative product/design specification. Business: Studio Nirmiti. Client: Kushal Kumar Pendekatla, phone 9573023509. Services: Architectural Designing, Interior Designing, Modular Kitchens, Furniture Selection, 3D Visualization, Walkthroughs, Project Supervision, Interiors, Exteriors, Execution Works and Space Planning. Project types: Residential, Commercial and Hospitality. The experience must be premium architectural 3D: tactile layers, perspective, spatial composition and subtle motion - not neon, not gaming, not giant type. Only the Home page may have a true hero section. Every inner page must begin directly with a contextual editorial/service intro block.

AGENT CHECKPOINT

Implement, run, inspect, test, then continue.

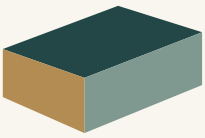

COPY / PASTE

MASTER PROMPT - PART 2

Paste these parts together as one master request, or send sequentially in the same Antigravity task.

MASTER PROMPT - PART 2

Implement the public site with the exact SEO route architecture from the blueprint. Primary content must render as semantic HTML and remain available with motion/3D disabled. Use descriptive lowercase hyphenated URLs, unique metadata, canonical URLs, breadcrumbs, structured data where accurate, XML sitemap, robots rules, accessible crawlable internal links and responsive optimized images. Build dynamic /projects/[slug] case studies and /insights/[slug] articles. Do not invent testimonials, awards, addresses, ratings, project counts or certifications. Use placeholders clearly labeled until the client supplies verified content.

AGENT CHECKPOINT

Implement, run, inspect, test, then continue.

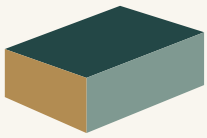

COPY / PASTE

MASTER PROMPT - PART 3

Paste these parts together as one master request, or send sequentially in the same Antigravity task.

MASTER PROMPT - PART 3

Use latest stable Next.js App Router + TypeScript and a tokenized styling system. For 3D use React Three Fiber/Three.js only in selected high-value sections; use Motion/GSAP for DOM animation. Dynamically import heavy scenes, cap DPR, pause offscreen rendering and supply static/reduced-motion fallbacks. Desktop pointer interactions can use gentle tilt/parallax; touch interactions must never interfere with vertical scrolling. All UI must be responsive and accessible.

AGENT CHECKPOINT

Implement, run, inspect, test, then continue.

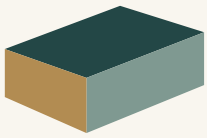

COPY / PASTE

MASTER PROMPT - PART 4

Paste these parts together as one master request, or send sequentially in the same Antigravity task.

MASTER PROMPT - PART 4

Build a secure admin system. Recommended backend is Firebase Auth + Firestore + Cloud Storage + App Hosting unless the workspace already has a better configured equivalent. Protect /admin. Roles: owner, admin, editor. Build dashboard modules for Pages, Services, Projects, Insights, Media, SEO, Navigation, Leads, Users/Roles, Global Settings and Revision History. Public users may read only published data. Validate uploads and writes with security rules/server validation.

AGENT CHECKPOINT

Implement, run, inspect, test, then continue.

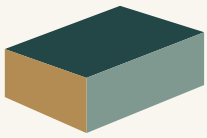

COPY / PASTE

MASTER PROMPT - PART 5

Paste these parts together as one master request, or send sequentially in the same Antigravity task.

MASTER PROMPT - PART 5

The admin page editor must visually clone the public page using the same section components. Clicking a section selects it. Allow editing all text, buttons and images; replacing media; changing alt text/focal point; drag-reordering, duplicating, hiding and deleting sections; adding sections from a component library; changing controlled layout variants, section density, alignment and approved background/theme tokens; desktop/tablet/mobile preview; draft/preview/publish; version history and rollback. Do not expose arbitrary raw CSS as the normal editing experience because it can break responsive design.

AGENT CHECKPOINT

Implement, run, inspect, test, then continue.

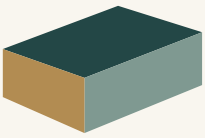

COPY / PASTE

MASTER PROMPT - PART 6

Paste these parts together as one master request, or send sequentially in the same Antigravity task.

MASTER PROMPT - PART 6

Work phase by phase and verify. First inspect workspace and plan. Build tokens/global shell/data model/auth. Then reusable sections and Home. Then every blueprint route. Then 3D enhancements. Then admin. Then SEO/schema. Then QA and deployment. At each phase run typecheck, lint, tests and production build. Use browser testing at mobile/tablet/desktop widths. Fix every overlap, empty state, broken link, clipped element and console error. Finish with a README, route inventory, admin guide, deployment instructions and a report of any remaining limitations.

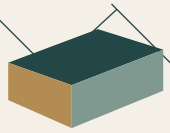

AGENT CHECKPOINT

Implement, run, inspect, test, then continue.

FINAL ACCEPTANCE

The finished build must satisfy this contract

Do not call the project complete until all acceptance criteria are verified.

Definition of done

46 blueprint routes implemented; dynamic projects/articles; Home-only hero rule respected; public SEO complete; premium 3D responsive behavior; admin visual editor can change all content and controlled layouts; media/projects/articles/leads/SEO manageable; secure roles; tests/build pass; no visual defects.

When reference video arrives

Analyze its motion rhythm, depth treatment, navigation and interaction patterns. Adapt those principles to Studio Nirmiti branding and the blueprint. Do not copy logos, text, images, exact assets or distinctive proprietary design wholesale.

Final agent response

Return live/preview URL if deployment is authorized, admin URL, test credentials only through a secure agreed channel, route checklist, test results, Lighthouse/Core Web Vitals snapshot if available, and concise handover notes.
